

Your gums say more than you think.

A calm, two-minute read.

Gum disease comes in two stages.

01 Gingivitis

The early stage. Gums look red or puffy, or bleed when you brush. With good daily care, it can usually be reversed.

02 Periodontitis

Can follow if gingivitis is left for a long time. It affects the tissue that holds your teeth in place.

If that sounds familiar, you're far from alone.

Most adults in the UK have gum disease to some degree, and many don't notice it.

Here's the interesting part

Gum specialists and heart specialists looked at the research together.

In 2020, they found that people with gum disease are more likely to also have heart disease.

“A link,
not a cause.”

It doesn't show that gum disease causes heart problems, or that treating your gums prevents them.

It's simply one more good reason to look after both.

Any of these sound familiar?

☐ Gums bleed when you brush or floss

☐ Gums look red or puffy

☐ Bad breath that lingers

☐ Gums pulling back from your teeth

Comment your number. *You're in good company.*

Every day

The daily easy wins.

-
- 01 Brush twice a day for about two minutes, with fluoride toothpaste.
 - 02 Clean between your teeth once a day, with floss or small interdental brushes.
 - 03 After brushing, spit, don't rinse, so the fluoride keeps working.
-

Three things worth asking for.

01 Check-ups as often as your dentist recommends.

02 A look at your gums, not just your teeth.

03 If your gums often bleed, whether a hygienist visit would help.

Coming soon

Dentistry is coming to The Wellness.

Save this for your next check-up, and share it
with someone who'd find it useful.
